

## Hilltop Birding

Bird species most commonly found on the Hilltop, their relative seasonal abundance and habitat requirements are listed in this document. A few rare occurrences have been left off the list. Bird populations also vary from year to year – thus, some species may increase in the future, or disappear as habitats change. Evidence for nesting in the Hilltop area has been accumulated sporadically since 1995.

*David Hall and Dennis German, 2018*

### CHECKLIST LEGEND:

#### Seasons

Many species migrate seasonally. For the Hilltop, we define those seasons as:

Winter: November through March

Spring: April, May

Summer: June through August

Fall: September, October

#### Abundance

A = Abundant, seen most times in proper habitat

C = Common, frequently seen in proper habitat

FC = Fairly Common, seen in proper habitat

U = Uncommon, species not seen very often

R = Rare, species occurs regularly, but in small numbers

O = Occasional, species has only been seen a few times over many years

#### Nesting

Confirmed breeding – ✓

Suspected / possible breeding – ?

Parasitizes other nests – **P** (e.g., lays its eggs in other birds' nests, for them to raise)

#### Habitat

Describes the sites where the species is found most often. Some birds move from one locale to another depending on the season. A few species do not prefer any habitat available at the Hilltop, but are seen commonly in flight (sky) or near the edge of the property (near homes). In addition to those species that prefer woods / thickets or open meadow, some species prefer the borders between those habitat types (edge), or open water (pond / detention basin).

#### Other Species Seen Less Often:

Species seen rarely and not listed here include: Bald Eagle, Brown Creeper, Acadian Flycatcher, Willow Flycatcher, Bay-breasted Warbler, Canada Warbler, Chestnut-sided Warbler, Nashville Warbler, Worm-eating Warbler, Field Sparrow, Rusty Blackbird and Winter Wren.
